|------|---|
| 2019 | PhD in Economics, University of Toronto (2013–present, expected July 2019) <i>Dissertation:</i> Understanding Short-Term Labor Supply Decisions <i>Committee:</i> Robert McMillan (supervisor), Kory Kroft, Aloysius Siow |
| 2012 | MA in Economics, University of British Columbia (2011–2012) |
| 2011 | BSc in Economics, Université de Montréal (2008–2011) <ul style="list-style-type: none">• Graduated with honours |

Awards

Ontario Graduate Scholarship, 2016–2017
Royal Bank Graduate Fellowships in Public and Economic Policy, 2016
University of Toronto Graduate Fellowship, 2013–2018
University of British Columbia Fellowship, 2011–2012
Roger-Dehem Award in Microeconomics, 2010
Outstanding Teaching Assistant Award, 2010

Conferences and Workshops

- NBER Summer Institute 2018, Labor Studies and Public Economics, Cambridge, MA
- Annual Conference of the Canadian Economic Association 2016, Ottawa, Canada
- Conference of the Société Canadienne de Science Économique 2016, Québec City, Canada

Research Papers

- Valuing Flexibility: A Model of Discretionary Rest Breaks (**job market paper**)
- The Daily Labor Supply Response to Worker-Specific Earnings Shocks

Work in Progress

- What Does the Meter Say? A New Approach to Quantifying Congestion Costs (with Jonathan Hall and Robert McMillan)
- Valuing Reputation: Evidence from Online Scams (with Daniel Ershov and Scott Orr)

Other Relevant Experience

2015-2018: Research Assistant, University of Toronto

- Supervisor: Jonathan Hall (2015–2018)
- Supervisor: Kory Kroft and Yao Luo (2017–2018)

2013-2018: Teaching Assistant, University of Toronto

- ECO339 – Labour Economics
- ECO446 – Advanced Public Economics
- ECO333 – Urban Economics
- ECO331 – Behavioural and Experimental Economics
- ECO372 – Applied Regression Analysis

2012-2013: Economist, Bank of Canada, Montréal, Québec

- Main research: The Impact of Fiscal Policy in Recessions

Computing Skills Python/Cython, GIS programming, R, SQL, Stata, MATLAB

Dissertation Abstract

Valuing Discretionary Rest Breaks (*Job Market Paper*)

As flexible work arrangements become increasingly prevalent in the labor market, more and more workers have discretion over when they take rest breaks. The appeal of this flexibility may be contributing to the rapid growth of the ‘gig’ economy. Yet we do not know how much workers value the ability to decide when to take rest breaks, nor is there any formal economic model of the process by which a worker makes this decision. To fill the gap, I develop and estimate the first dynamic model of daily labor supply that incorporates rest breaks. The model includes several factors that influence the decision to take breaks: fatigue, opportunity costs, preferences across hours of the day, and random utility shocks. I estimate the model using high-frequency data on millions of taxi trips covering over 14,000 drivers in NYC during an entire year. This allows me to characterize heterogeneity across drivers in a flexible and transparent way, estimating the model separately for each driver. Using the estimated parameters, I first evaluate the welfare loss to workers if discretionary breaks were replaced by scheduled breaks. My results show that flexibility is valued highly: the average driver in my sample would require a 22 percent increase in revenue to accept a counterfactual fixed work schedule. Further, I find substantial heterogeneity in this valuation, indicating that for some workers, discretionary breaks bestow a large non-pecuniary benefit. I then use the model to study the effects of a realistic ‘mandatory breaks’ policy on the frequency of breaks and labor supply. Counterfactual evidence shows that such a policy would substantially increase the frequency of breaks but would reduce labor supply by 6 to 9 percent. This result highlights the need to weigh the benefits of break-oriented policies—including a reduction in accidents—with the negative consequences for labor supply and the welfare of workers. While I use a specific industry to estimate the model, the proposed framework is quite general and can be applied to various sectors of the labor market.

The Daily Labor Supply Response to Worker-Specific Earnings Shocks

This paper presents empirical evidence indicating that the daily labor supply response of workers in response to small windfall gains (i.e. worker-specific income shocks) is large and negative, contrary to the prediction of the standard neoclassical model. I use microdata covering the universe of New York taxi trips to reconstruct drivers’ daily work shifts in 2013. In the main specification, I identify windfall gains using tips received by drivers and find that they respond to these shocks by *decreasing* their labor supply substantially. Because tips are very common for American taxi drivers, I restrict the analysis to tips that are larger than average but still represent a negligible part of a driver’s monthly or weekly earnings. I obtain similar results when using trips from Manhattan to JFK Airport as an indicator of positive idiosyncratic earnings. I also find that these shocks do not affect future labor supply, indicating that standard neoclassical income effects cannot explain this result. In contrast, a positive shock to average hourly earnings causes drivers’ labor supply to increase, consistent with optimizing rational agency. The large and negative response to small windfall gains suggests that they can have significant effects and should not be neglected when designing labor policies, especially when tips, commissions, or bonuses are involved.
